

What's in a computer?

Alice

CPU

CPU stands for "Central Processing Unit" and is the brain of a computer!

PSU

PSU stands for "Power Supply Unit". It is responsible for controlling power and electricity.

Motherboard

A motherboard holds the CPU and other important internal hardware (things inside a case).

CASE

A place that has most of the hardware of a personal computer. Things inside a case is called 'internal hardware' and things outside the case are called 'peripherals' or 'external hardware'.

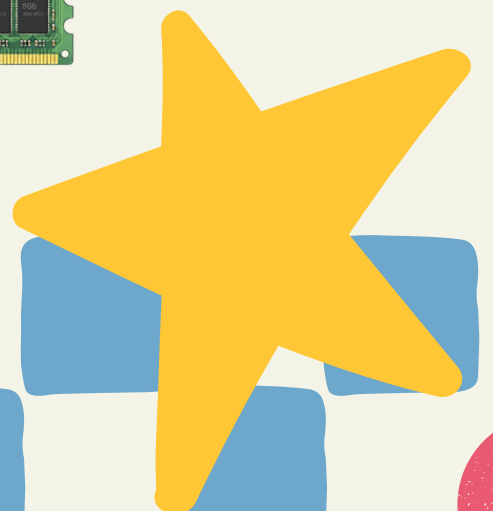

SSD & HDD

A HDD (Hard Disk Drive) is best for storing a big amount of data cheaply and a SSD (Solid State Drive) is used to run the operating system (the brain) and apps. The SSD prioritises speed.

RAM

RAM stands for "Random Access Memory". It is used for temporarily storing memory. This memory is volatile (it disappears when you close your computer)!

What's in a computer?

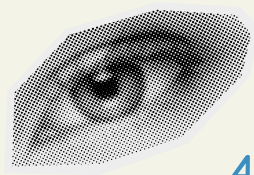

Optical Drive

The Optical Drive helps a computer interact (connect) with non-magnetic external (outside) items, like a video disk.

NIC

NIC stands for "Network Interface Card" and it is a circuit board or chip that allows a computer to connect to a network adapter which translates digital information into signals. It can work wirelessly or be wired.

A screen that displays texts, pictures and videos
Monitor

Did you know?
Apple sold their first computer, the Apple-I on July 1976 for \$666.66!

Mouse tool!

A keyboard helps you write texts onto the computer.

Keyboard

Mouse

A mouse helps you control a pointer and click on things (like clicking on applications).

Did you know?
Our keyboard's QWERT layout is meant to make us type slower! This idea was made by Christopher Sholes.

GPU

GPU stands for "Graphical Processing Unit" and is a chip that processes graphical data. It is used as an extension of the main CPU. It also releases a lot of heat (buy a cooler)!
