

Computer Hardware

By: Elly

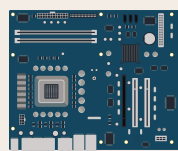

1 Case

A computer case is like your pencil case. It holds the things that a computer needs in order to function daily.

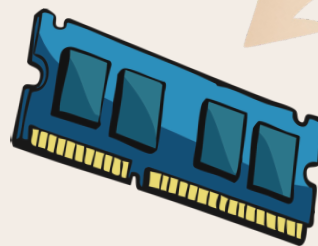

2. PSU

A PSU (Power Supply Unit), is like a charger. It gives power to all the different parts of the computer so that they can work.

3. Motherboard

A Motherboard is like a board that does the things your parents usually do. It helps the computer and holds important internal hardware but also acts as the center that the important internal hardware can work together.

4. RAM

A RAM (Random Access Memory) is like a desk. It holds the things that the computer is working on so that it can quickly get the information.
(But once the things on the desks aren't being used, they get cleaned up so the RAM can't remember the stored information)

5. HDD/SSD

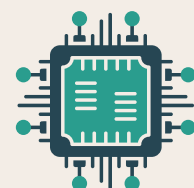

HDD

An HDD (Hard Disk Drive) is like a gramophone. It spins around and stores information for the computer.

SSD

An SSD (Solid State Drive) is like a storage box. It stores the information and things for the computer so they can be used later.

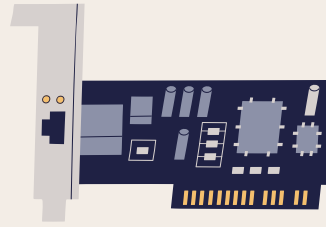

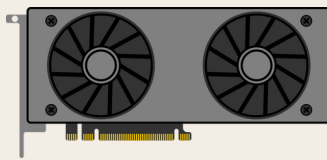

6. CPU

A CPU (Central Processing Unit) is like the brain of the computer. It follows instructions and help the computer do things.

7. GPU

A GPU (Graphics Processing Unit) is like an artist. It makes pictures or designs that you see on the computer screen.

8. NIC

A NIC (Network Interface Card) is like a mailbox. It helps the computer send or receive letters or information through a network, like the g-mail.

9. Mouse

A mouse is like your finger. It lets you point at things, click things and also move things around on the computer screen.

10. Keyboard

A keyboard is like a typewriter. It lets you type letters, numbers, and symbols into the computer.

11. Monitor

A monitor is like a TV. It shows you the graphics or things on the screen that the computer is displaying.

12. Optical Drive

An optical drive is like a CD player. It gets information from CDs and DVDs and some can even put information in them too.
